

How to Use Pantone Metallic Colors

GX Print Server for
Iridesse Production Press

Version 1.0

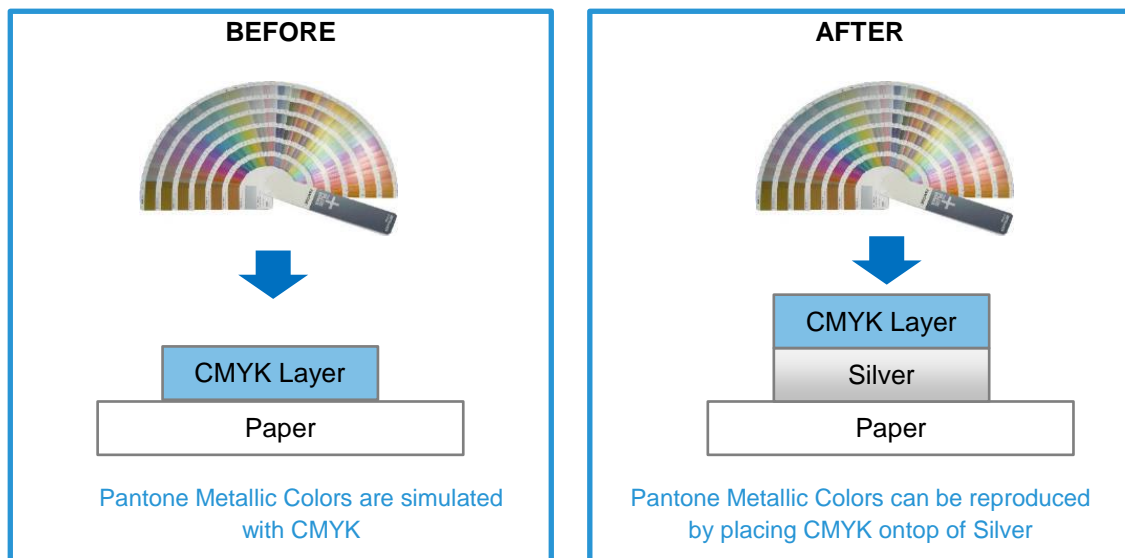

Overview

This exercise will demonstrate the ability for the GX Print Server to reproduce metallic colors by placing CMYK on top of underlying silver dry ink. The demonstration will show Pantone Metallic Colors can be reproduced with silver dry ink in easy steps with the GX Print Server. The user has the ability to create a job which includes Pantone Metallic Colors by using Adobe applications. This exercise will also demonstrate how to configure Job Properties on the GX Print Server to enable printing Pantone Spot Colors with silver dry ink.

Objective

By the end of this exercise users will be able to:

- Create a job that includes Pantone Metallic Colors with Adobe applications
- Find the location of the setting on the GX Print Server
- Enable printing Pantone Metallic Colors using silver dry ink

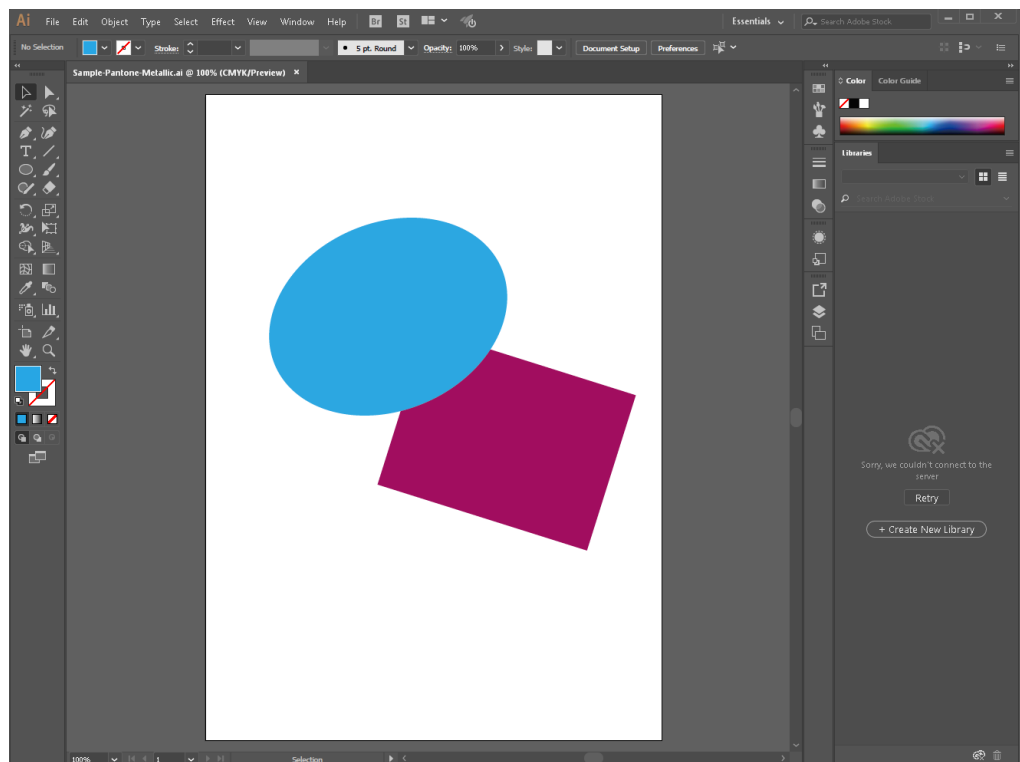

Specify a Spot Color in the Client Application

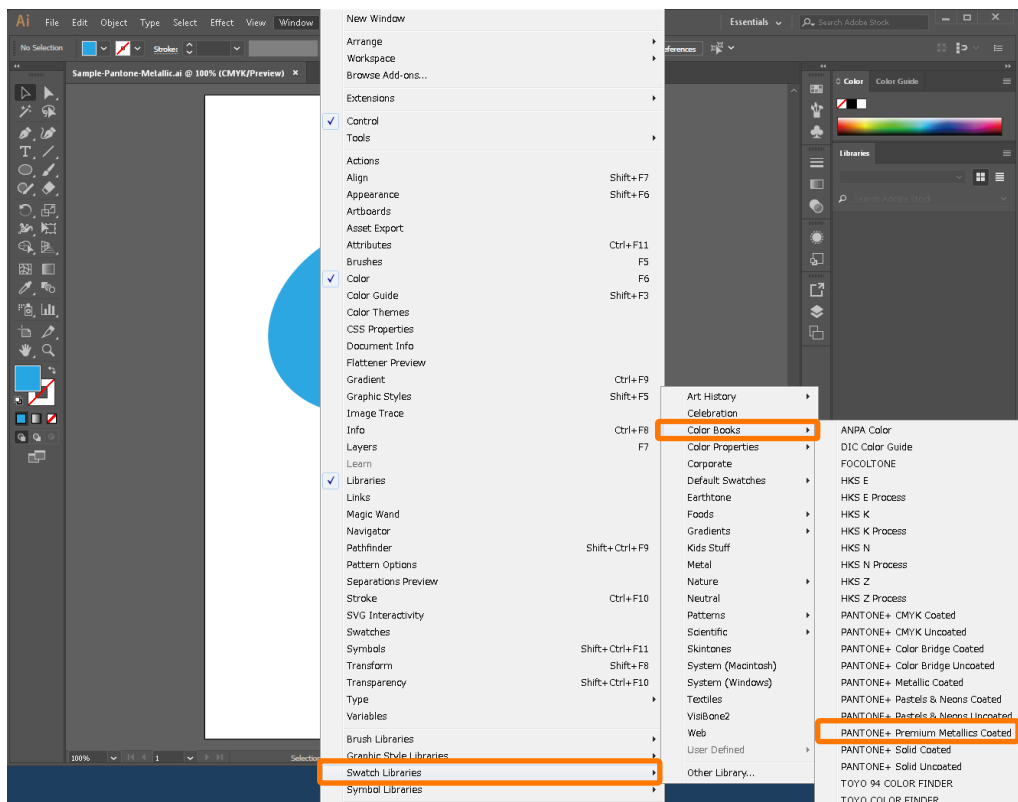

This demonstration shows the example of using Adobe Illustrator CC. You can also specify Pantone Metallic Colors from Adobe Photoshop, InDesign, and other applications when referring to this instruction.

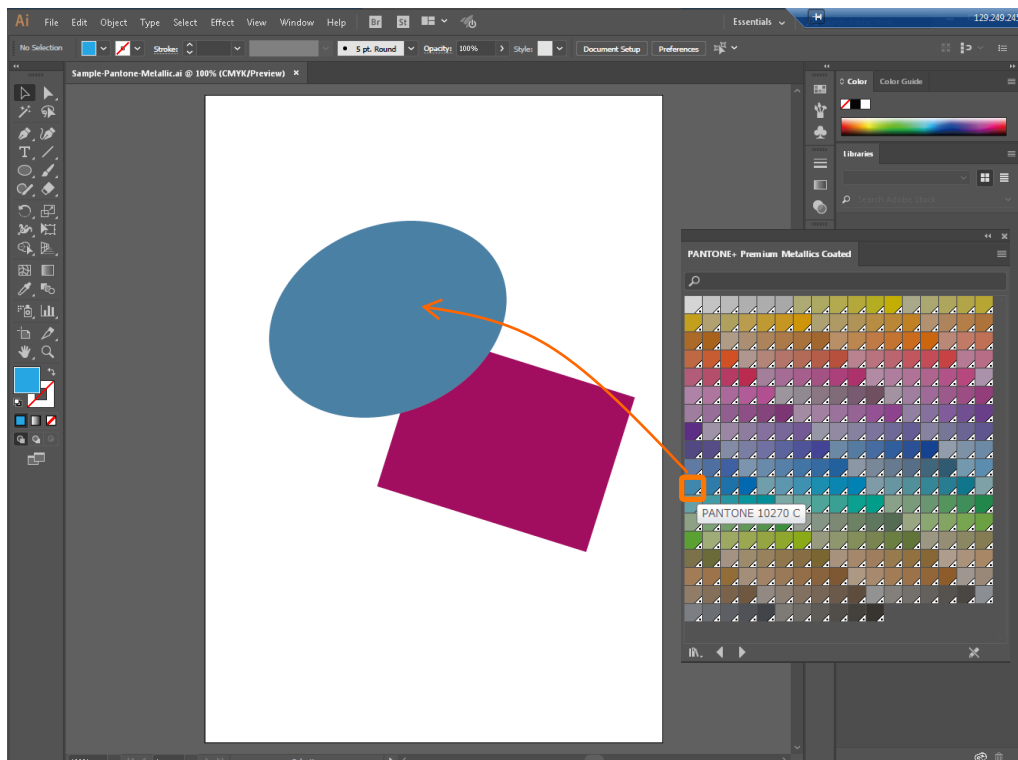

1. Create an object using Adobe Illustrator CC.

2. Open [Window] > [Swatch Libraries] > [Color Books] > [PANTONE+ Premium Metallic Coated].

3. Specify [PANTONE 10270 C] as the object color.

4. Send this data to the GX Print Server by using either the Printer Driver or Importing the PDF file.

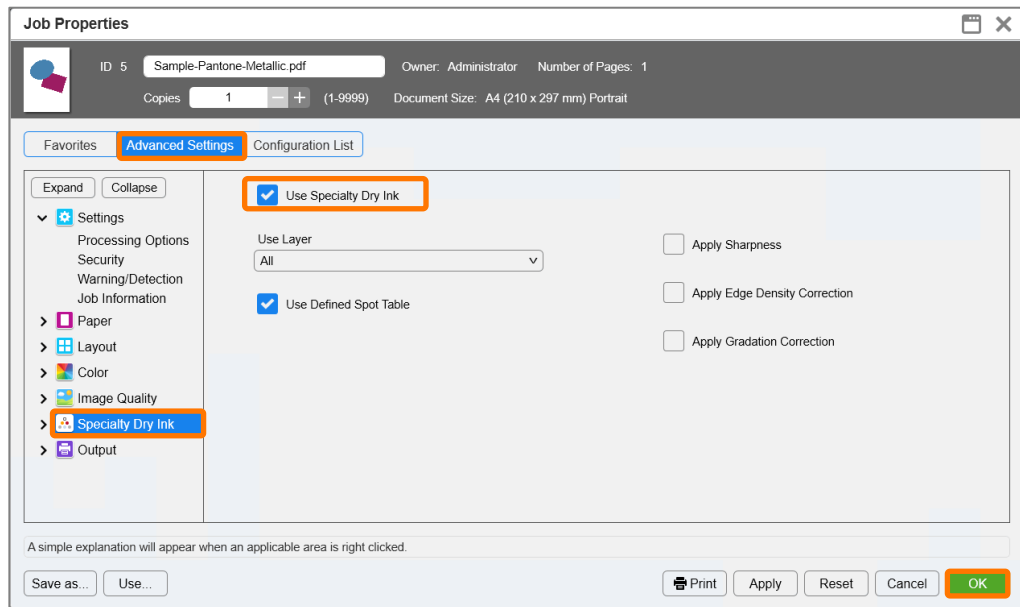

Congratulations you have now completed the task of creating a job that includes Pantone Metallic Colors. Please continue to the next exercise of configuring Job Properties to get output with silver dry ink on GX Print Server.

Configuration of the Job Properties

Please note, this How To document is part of a set. If you cannot complete some of the following steps please refer to the other reference documents. i.e “Open the Job Properties” is further explained in the “How to import a job.pdf”. Go to: http://m1-onlinesupport.fujixerox.com/driver_downloads/OTS/OTS_gxprintserver_irdesse_EN.html

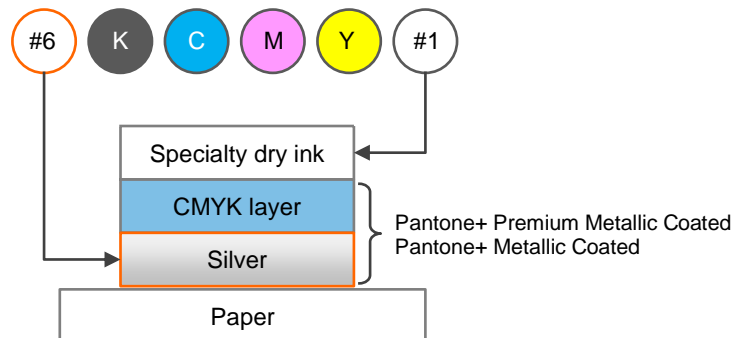

1. Open the Job Properties and move to [Advanced Settings] > [Specialty Dry Ink]. Then, enable [Use Specialty Dry Ink] and click [OK].

If [Use Specialty Dry Ink] is disabled as the default, Pantone Metallic Colors included in the job will be simulated with CMYK only.

When Pantone+ Premium Metallic Coated and Pantone+ Metallic Coated silver dry ink is required as under print, it must be installed in the printer at engine position #6. If another dry ink such as gold is there, or if there is no dry ink at all, the job fails when it starts printing.

Congratulations you have now completed this exercise.
